

ARE YOUR CALVES BOVATEC® BIG?

Bovatec® is a unique ionophore feed additive that increases average daily gain (ADG) of cattle on different types of pasture during any season of the year. When fed daily at the recommended level of 200 mg/head/day, Bovatec can maintain gain regardless of weather and forage quality, leading to greater return on investment for your operation.

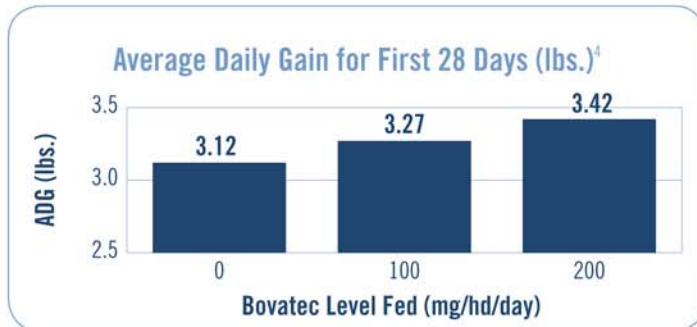

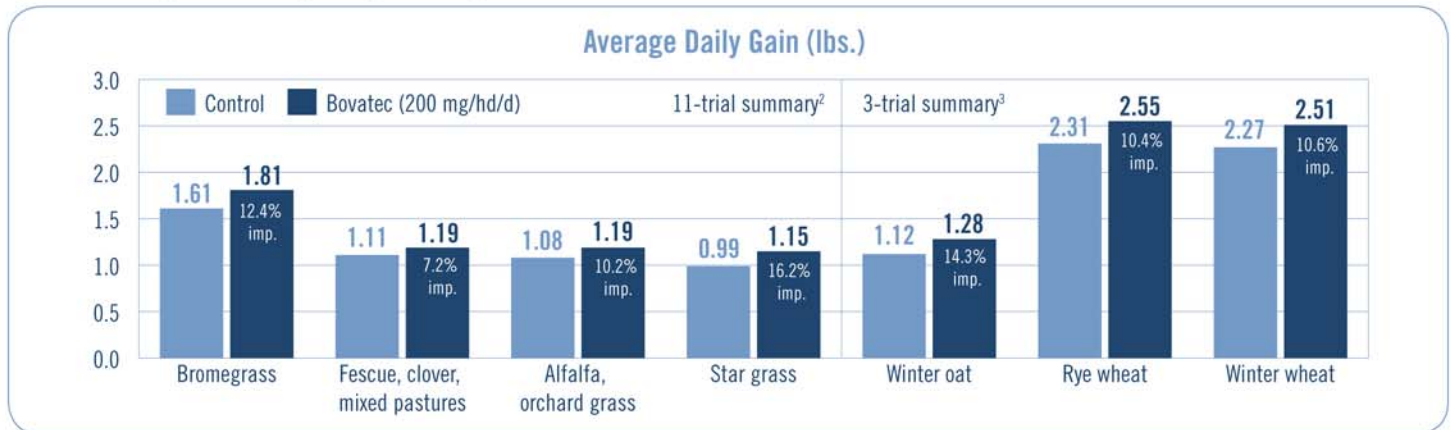

Feeding Bovatec in pasture diets has multiple benefits that result in improved profit margins, including:

- Increased ADG regardless of season, weather or forage quality.
- Reduced feed cost by optimizing ADG on forages with less energy or with limited intake.
- Reaching puberty sooner, allowing animals to enter the production cycle sooner.
- Optimized productivity of available pasture resources, yielding more beef per acre.

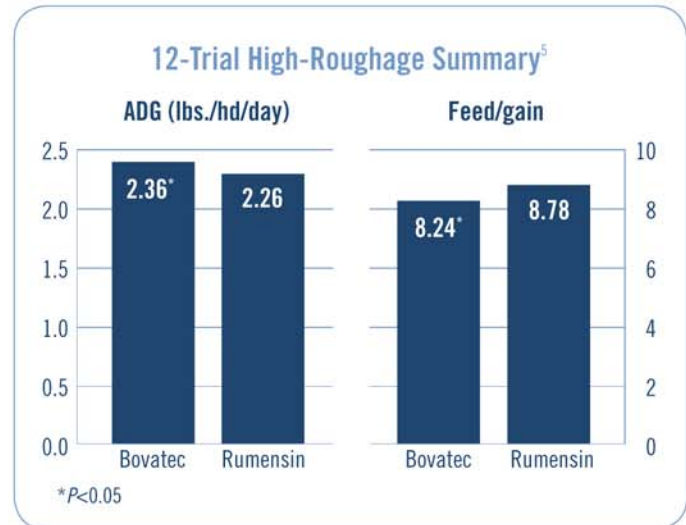

WHAT THE RESEARCH SAYS

FEEDING BOVATEC® TO PASTURE CATTLE CAN HAVE MULTIPLE BENEFITS, INCLUDING:

Additional gains on any forage, in any season

Cattle adapt easily to Bovatec; no step-up program is required.

4% improved Average Daily Gain and 6% improved feed efficiency in high-roughage rations.
